

## Connecting to Moore Wi-Fi from Windows and Macs

Connecting to **Moore Wi-Fi** *should* be straightforward. What you need to do is the same for all devices. How to do it will depend on the exact kind of Windows or Mac you have!

The generic steps are –

1. Go to your computer's Wi-Fi menu
2. Select **Moore Wi-Fi**
3. The computer will prompt for your Username and Password. The Username field might be called "Identity".
  - a. Enter your **Universal Login and Password** in the fields.
  - b. Optional - The computer may want a Domain Name. If it does, enter **Moore**
  - c. Optional – you can choose to have your device connect automatically whenever it finds the Moore Wi-Fi network.
4. Macs and some PCs will need to trust a certificate. If you get this prompt, click "Trust" or "Accept". On a Mac you will probably need to enter an administrator password or your Mac user account password to do this. The certificate should say it is from either –
  - a. AD5.moore.local
  - b. AD6.moore.local

Eventually you will need to trust **both** of these certificates.

Your computer should remember these details. You should only need to enter them again when you change your password.
